Project Proposal Year IV

Student Name:	Jessica Curran	Student Number:	C00300855
Working Title:	ThePixelPatch		
Description:	ThePixelPatch will be a website that will showcase all of my pixel art asset packs that I am going to create. My goal is to create 10 or more unique asset packs, each having its own theme and collection of pixel art assets. Some of the themes I am already considering include Farming, Space, Food, Landscapes, Nature and more with additional themes being developed as the project progresses. Each asset pack will be designed so that it can be downloaded and used in a variety of different games and project. The packs could be useful to a range of people such as indie game developers or students who might want to try to create a game but wouldn't have time or maybe the ability to create all of their own assets from scratch. The assets could be used for many different types of games for example platformers, RPGs, farming games, adventure games and many more. The website itself will be a place where users can browse, preview and download each asset pack. Every asset pack will have its own page that will contain information about the theme, what assets are included and maybe some examples of how the assets could be implemented into a game. I also want the user to be able to see all of the assets in detail before downloading the pack. This will include displaying the sprite sheets, individual PNGs, animations and any other artwork that is included in the pack. A key part of the site will be allowing the user to see exactly what is included in the pack before downloading anything. This website will also be designed to have a simple but consistent theme that is visually appealing and easy to navigate. Users should be able to easily browse through the different categories, select an asset pack, view its contents and then simply press a button to download the pack. Finally, I would love to implement a feature on each asset pack page where users could review and showcase if they used that asset pack in their game. They could leave a comment or review about their experiences and if they have implemented the assets in their game, be able to upload screenshots or images showing how they used them. This would help create a small community on the site where users can share their work, provide feedback, and show how the assets look in the games and projects they have created.		
Reasons for selecting project:	For the last few years, I have grown to absolutely love pixel art, and I find myself creating it all of the time. So far I have created two full asset packs for small games that I have worked on over the past year. In the future, I would love to work on a

	larger scale pixel art game and be a part of a team with multiple other people working together to create assets rather than creating everything myself like I have done previously. I feel as though this project would greatly further my skills as I would be working on a wide range of assets that could be implemented into so many different types of games. I would love to create a game with my own assets, but my coding skills are very limited so that's why I have decided to create this site instead. I consider myself much more of an artist than a coder, so developing this website will push me outside of my comfort zone and allow me to improve my coding and web development skills, while still focusing on something I am passionate about and that isn't too ambitious for my skill level. I love creating game assets and seeing them being used within a game so this site will be a way to create assets and display them with hopes that people will download them to use in their games. From my previous experiences creating game assets, I already understand how time consuming the process can be, especially when creating complex animations, which can sometimes take weeks to complete. Because of this, I know that creating such a large collection of asset packs will be challenging and require a lot of time and effort. However, I believe the experience that I will gain from this project will be extremely valuable for my future, as creating pixel art and game assets is something that I would love to pursue as a career. Ultimately, my goal is to work as part of a larger game development team and create assets and artwork for a larger scale game.
